WE CLAIM:

5

10

15

- 1. A computer system comprising a plurality of processor clusters interconnected by a plurality of point-to-point inter-cluster links, each processor cluster comprising nodes including a plurality of local processors and an interconnection controller interconnected by a plurality of point-to-point intra-cluster links, communications within a cluster being made via an intra-cluster protocol that uses intra-cluster packets, wherein the interconnection controller in each cluster is operable to map locally-generated communications directed to others of the clusters to the point-to-point inter-cluster links and to map remotely-generated communications directed to the local nodes to the point-to-point intra-cluster links, communications between clusters being made via an inter-cluster protocol that uses inter-cluster packets, an inter-cluster packet encapsulating at least one intra-cluster packet, each interconnection controller configured to compute a first cyclic redundancy code check for, and to encode first cyclic redundancy code check data in, each inter-cluster packet transmitted on the point-to-point inter-cluster links.
- 2. The computer system of claim 1, wherein each interconnection controller is further configured to compute a second cyclic redundancy code check for each inter-cluster packet received on the point-to-point inter-cluster links.

20

3. The computer system of claim 1, wherein each interconnection controller is further configured to transmit each inter-cluster packet as an indivisible unit on the point-to-point inter-cluster links.

- 4. The computer system of claim 1, wherein each interconnection controller is further configured to encode a sequence identifier in each inter-cluster packet transmitted on the point-to-point inter-cluster links.
- 5. The computer system of claim 1, wherein the nodes are configured to compute a cyclic redundancy code check on a transmission window that includes transmissions of multiple intra-cluster packets on the point-to-point intra-cluster links.
- 6. The computer system of claim 1, wherein each interconnection controller is further configured to compute a cyclic redundancy code check on a transmission window that includes transmissions of multiple intra-cluster packets on the point-to-point intra-cluster links.
- 7. The computer system of claim 1, wherein each interconnection controller encodes the cyclic redundancy code check data in a field reserved for a link layer of each inter-cluster packet transmitted on the point-to-point inter-cluster links.

8. A computer system, comprising:

5

10

15

20

25

a first cluster including a first plurality of processors and a first interconnection controller, the first plurality of processors and the first interconnection controller interconnected by first point-to-point intra-cluster links; and

a second cluster including a second plurality of processors and a second interconnection controller, the second plurality of processors and the second interconnection controller interconnected by second point-to-point intra-cluster links, the first interconnection controller coupled to the second interconnection controller by point-to-point inter-cluster links;

wherein the first interconnection controller is configured to:

5

10

15

20

25

receive a request according to an intra-cluster protocol from a first processor in the first plurality of processors;

generate a probe packet responsive to the request;

compute a first cyclic redundancy code check based only upon bits in the probe packet;

encode first cyclic redundancy code check data in the probe packet; and

send the probe packet to the second interconnection controller in the second cluster.

- 9. The computer system of claim 8, wherein the first interconnection controller is further configured to encode a sequence identifier in the probe packet.
- 10. The computer system of claim 8, wherein the second interconnection controller is configured to compute a second cyclic redundancy code check based only upon bits in the first probe packet.
- 11. The computer system of claim 8, wherein the second interconnection controller is configured to forward the probe packet according to the intra-cluster protocol to a processor in the second plurality of processors.
 - 12. The computer system of claim 8, wherein the second interconnection controller is configured to forward the probe packet according to the intra-cluster protocol to each processor in the second plurality of processors.

- 13. The computer system of claim 11, wherein the processor in the second plurality of processors is configured to send a response packet according to the intra-cluster protocol to the second interconnection controller.
- 14. The computer system of claim 12, wherein each processor in the second plurality of processors is configured to send a response packet according to the intra-cluster protocol to the second interconnection controller.

15. An interconnection controller, comprising:

an intra-cluster interface configured for coupling with intra-cluster links to a plurality of local processors arranged in a point-to-point architecture in a local cluster;

an inter-cluster interface configured for coupling with an inter-cluster link to a non-local interconnection controller in a non-local cluster;

- a transceiver configured to receive an intra-cluster packet from a local processor via an intra-cluster link and encode a sequence identifier in a header of the intra-cluster packet; and
- a serializer/deserializer configured to serialize the encoded packet and forward the encoded, serialized packet to the inter-cluster interface for transmission to the non-local interconnection controller via an inter-cluster link.
- 16. The interconnection controller of claim 15, wherein the transceiver is further configured to compute a cyclic redundancy code check based only on the encoded packet and to encode the cyclic redundancy code check in the encoded packet.

5

10

15

20

- 17. The interconnection controller of claim 15, wherein the inter-cluster interface is further configured to receive encoded, serialized packets from the non-local interconnection controller, wherein the serializer/deserializer is further configured to deserialize the encoded, serialized packets and wherein the transceiver is further configured to perform a cyclic redundancy code check on the deserialized packets.
 - 18. An integrated circuit comprising the interconnection controller of claim 15.
- 19. A set of semiconductor processing masks representative of at least a portion of the interconnection controller of claim 15.

5

15

20

25

- 20. At least one computer-readable medium having data structures stored therein representative of the interconnection controller of claim 15.
- 21. The integrated circuit of claim 18, wherein the integrated circuit comprises an application-specific integrated circuit.
 - 22. The at least one computer-readable medium of claim 20, wherein the data structures comprise a simulatable representation of the interconnection controller.

23. The at least one computer-readable medium of claim 20, wherein the data structures comprise a code description of the interconnection controller.

24. The at least one computer-readable medium of claim 22, wherein the simulatable representation comprises a netlist.

- 25. The at least one computer-readable medium of claim 23, wherein the code description corresponds to a hardware description language.
- 26. A computer-implemented method for detecting errors in a computer system comprising a plurality of clusters, each cluster including a plurality of local nodes and an interconnection controller interconnected by point-to-point intra-cluster links, communications between the local nodes and the interconnection controller made via an intra-cluster protocol using intra-cluster packets, the interconnection controller of each cluster interconnected by point-to-point inter-cluster links with the interconnection controller of other clusters, the computer-implemented method comprising:

5

10

15

20

25

forming an inter-cluster packet by encapsulating an intra-cluster packet; encoding a sequence identifier in the inter-cluster packet;

calculating first cyclic redundancy code check data based only upon the inter-cluster packet;

encoding the first cyclic redundancy code check data in the inter-cluster packet; and transmitting the inter-cluster packet from a first interconnection controller to a second interconnection controller on a point-to-point inter-cluster link.

- 27. The computer-implemented method of claim 26, wherein the encoding steps comprise encoding in an area of the inter-cluster packet reserved for link layer information.
- 28. The computer-implemented method of claim 26, further comprising: receiving the inter-cluster packet; and calculating second cyclic redundancy code check data based only upon the intercluster packet.

29. The computer-implemented method of claim 28, further comprising: detecting an error in the inter-cluster packet based upon the second cyclic redundancy code check data; and

notifying the first interconnection controller of the error.

5

10

30. An apparatus for detecting errors in a computer system comprising a plurality of clusters, each cluster including a plurality of local nodes and an interconnection controller interconnected by point-to-point intra-cluster links, communications between the local nodes and the interconnection controller made via an intra-cluster protocol using intra-cluster packets, the interconnection controller of each cluster interconnected by point-to-point intercluster links with the interconnection controller of other clusters, the apparatus comprising:

means for forming an inter-cluster packet by encapsulating an intra-cluster packet; means for encoding a sequence identifier in the inter-cluster packet;

means for calculating first cyclic redundancy code check data based only upon the inter-cluster packet;

means for encoding the first cyclic redundancy code check data in the inter-cluster packet; and

means for transmitting the inter-cluster packet from a first interconnection controller to a second interconnection controller on a point-to-point inter-cluster link.
